

HMS Test Summary Report

Hospital Management System – Manual Testing Project

Prepared By: Sourav Halder

Testing Tool: Jira

Date: 11 May 2026

1. Project Overview

Manual testing was performed on a Hospital Management System developed using PHP and MySQL. Testing activities focused on validating core functionalities, CRUD operations, authentication flow, form validation, and user workflows across multiple system modules. Jira was used for test management, issue tracking, and monitoring bug status throughout the testing lifecycle.

2. Testing Scope

- Login & Authentication
- Department Management
- Doctor Management
- Patient Management
- Appointment Scheduling
- Medical Records
- Billing

3. Testing Types Performed

- Functional Testing
- Negative Testing
- Boundary Value Testing
- CRUD Validation
- Form Validation
- Retesting
- Regression Testing

4. Test Execution Summary

Metric	Count
Total Test Cases	64
Passed	58
Failed	6
Blocked	0
Bugs Identified	6
Retested	6

5. Bug Summary

Bug ID	Module	Severity	Status
HMS-72	Login & Authentication	Medium	Fixed
HMS-73	Doctor Management	High	Retested
HMS-74	Doctor Management	Medium	Open
HMS-75	Dashboard Access	High	Closed
HMS-76	Form Validation	Medium	Fixed

HMS-77	Appointment Scheduling	Low	Retested
--------	------------------------	-----	----------

6. Key Findings

- Authentication redirection issue was identified and fixed.
- Validation problems were discovered in the Doctor Management module.
- Form validation weaknesses were identified across multiple forms.
- Retesting was completed after bug fixes to verify system stability.
- CRUD operations across major modules were successfully validated.

7. Conclusion

Major functional modules of the Hospital Management System were successfully tested through structured manual testing activities. Bugs were identified, reported, tracked in Jira, and retested after fixes to ensure application stability and functionality. This project enhanced practical understanding of software testing workflows, defect management, and QA processes in a real-world testing environment.
